

A truly effective commercial security system must be smart enough to provide intrusion, fire, access control and network monitoring for today's needs—and flexible enough to expand as needs change.

With one interface that controls as many integrated functions as you need, you're assured flexible control and ease of system operation. Integrated systems simplify operation by multi-tasking for you—unlocking a door and turning off security sensors simultaneously. Integration maintains high security automatically, and requires less training to achieve optimum results.

COST-SAVING NETWORK MONITORING

Network communication via iCOM™ Technology achieves faster, less expensive, more secure alarm signaling to the central monitoring station without the expense of leased telephone lines.

The glass Clear Touch™ keypad backlighting changes color during an alarm—and distinct sound patterns indicate type of alarm—providing users with both a visual and audible alert.

COST-SAVING AREA INDEPENDENCE

Tailor your system control over independent areas based on your specific needs. Areas can have their own keypads, zones, account numbers, and arming and disarming schedules for maximum performance with maximum convenience and flexibility. Because one panel can cover multiple areas, the cost savings are significant.

BUILT-IN FALSE-ALARM REDUCTION

False-alarm-reduction features are built into every integrated system we install, and they are fully compliant with the Security Industry Association Standard for False Alarm Reduction.

INTEGRATED FIRE MONITORING

We offer integrated local control of addressable fire systems featuring manual pull-stations, smoke and heat detectors and water-flow supervision.

EASY SYSTEM OPERATION

Instead of demanding a complex series of keystrokes, our keypads feature simple menus that guide users through system operation. The unique access control Prox Patch adheres permanently to portable surfaces so you can turn a wallet or cell phone—or an existing ID card—into an access control wand. Prox Patch software includes options for credential verification and anti-passback control. Our integrated solutions initiate authorization, door activation, and security disarming at the same time with a single credential.

CONVENIENCE FEATURES THAT PAY OFF

Your integrated system can automatically report opening and closing times, staff arrival times, and sensor activation times right at the keypad—for quick, efficient information gathering from the same interface you use to operate the system!

Use System Link™ software on your PC to remotely arm and disarm, lock or unlock access control doors, add or delete system users, and run reports for analysis and evaluation.
